MC Package Bare Evaluation Board User Guide

DESCRIPTION

Bare evaluation boards offer a method for evaluating Allegro current sensors in a lab environment. This document describes the use of the MC current sensor evaluation board. This evaluation board (ACSEVB-MC16, TED-0004115) is intended for use with any MC package (16-pin SOICW Allegro current sensor).

FEATURES OF THE BARE BOARD

- Enhanced thermal performance
  - □ 6-layer PCB with 2 oz copper weight on all layers
  - □ Nonconductive-filled via-in-pad
  - □ High-performance FR4 material with 180°C glass transition temperature
- Flexible layout for user-installed connection points
  - □ Standard Keystone test points
  - □ SMA/SMB connector
  - □ 2-pin headers
- Integrated current loop resistance can be measured directly on the evaluation board after test point installation; voltage drop can be measured for approximating power loss in the package.

BARE EVALUATION BOARD CONTENTS

- **NOTE:** It is up to the user to assemble the board with the desired current sensor and supporting circuitry. This board does not come populated with an Allegro current sensor or other components.
- Recommended supporting circuitry for all compatible current sensor are listed in the Supporting Circuitry section below.

USING THE EVALUATION BOARD

Evaluation Board Procedure

SETTING UP THE EVALUATION BOARD

Upon receiving the evaluation board, it us up to the user to populate the evaluation board with the desired Allegro current sensor. It is also up to the user to install test points, SMA/SMB connectors, header connectors, and supporting circuitry, as needed.

CONNECTING TO THE EVALUATION BOARD

The most reliable way to connect measurement instruments to the evaluation board is to use SMB/SMA or 2-pin headers connectors along with coaxial cables. This configuration will be most resilient to external coupling and is the most mechanically stable and it is the preferred way for measurement for high-speed signal.
Keystone test points are a convenient way to connect any instrument, but is it recommended for DC setups only.

## Evaluation Board Detailed Description

1. U1 is a MC package footprint (pin 1 is on bottom left side of the package footprint, see the small white dot to the left of the package footprint).

2. U1 pins (16 to 9; see top and bottom view of EVB) allow the option to connect:

    ♦ RPU: pull-up resistor to VCC
    ♦ RPD: pull-down resistor to GND
    ♦ C: decoupling or load capacitor to GND

    NOTE: Even pin number components are on the top layer of the evaluation board (16, 14, 12, and 10) and odd pin numbers are on the bottom layer of the board (9, 11, 13, and 15). All passive components are 0603 package size.

3. Optional through hole test points (Keystone 5005 test points, e.g., Digikey# 36-5005-ND)

4. Optional standard SMB or SMA connection points (e.g., Digikey# 1868-1429-ND)

5. Optional 2-pin 100 mil header connector (note: either SMB or header can be assembled)

6. Primary current cables mounting positions (positive current flow direction is left to right)

7. Optional 2-pin 100 mil header connector for voltage drop measurement across the integrated current loop of the current sensor

8. RB1, RB2, RB3, and RB4: rubber bumper mounting positions (e.g., Digikey# SJ61A6-ND)

EVALUATION BOARD PERFORMANCE DATA

Thermal Rise vs. Primary Current

Self-heating due to the flow of current in the package IP conductor should be considered during the design of any current sensing system. The sensor, printed circuit board (PCB), and contacts to the PCB will generate heat and act as a heat sink as current moves through the system.

The thermal response is highly dependent on PCB layout, copper thickness, cooling techniques, and the profile of the injected current. The current profile includes peak current value, current on-time, and duty cycle.

Placing vias under the copper pads of the Allegro current sensor evaluation board minimize the current path resistance and improves heatsinking to the PCB, while vias outside of the pads limit the current path to the top of the PCB trace and have worse heatsinking under the part (see Figure 4 and Figure 5 below). The ACSEVB-MC16 does include vias in pad and is recommended to improve thermal performance.

Figure 4: Vias Under Copper Pads Example

Figure 5: No Vias Under Copper Pads Example

The plot in Figure 6 shows the measured rise in steady-state die temperature of the MC package versus DC continuous current at an ambient temperature, T_A, of 25 °C for two board designs: filled vias under copper pads and no vias under copper pads.

Note: Using in-pad vias has better thermal performance that no in-pad vias, and this is the design the ACSEVB-MC16 uses.

Figure 6: MC Package Comparison with and without In-Pad Vias

The thermal capacity of the MC package should be verified by the end user in the application's specific conditions. The maximum junction temperature, $T_{J(max)}$ (165°C), should not be exceeded. Measuring the temperature of the top of the package is a close approximation of the die temperature.
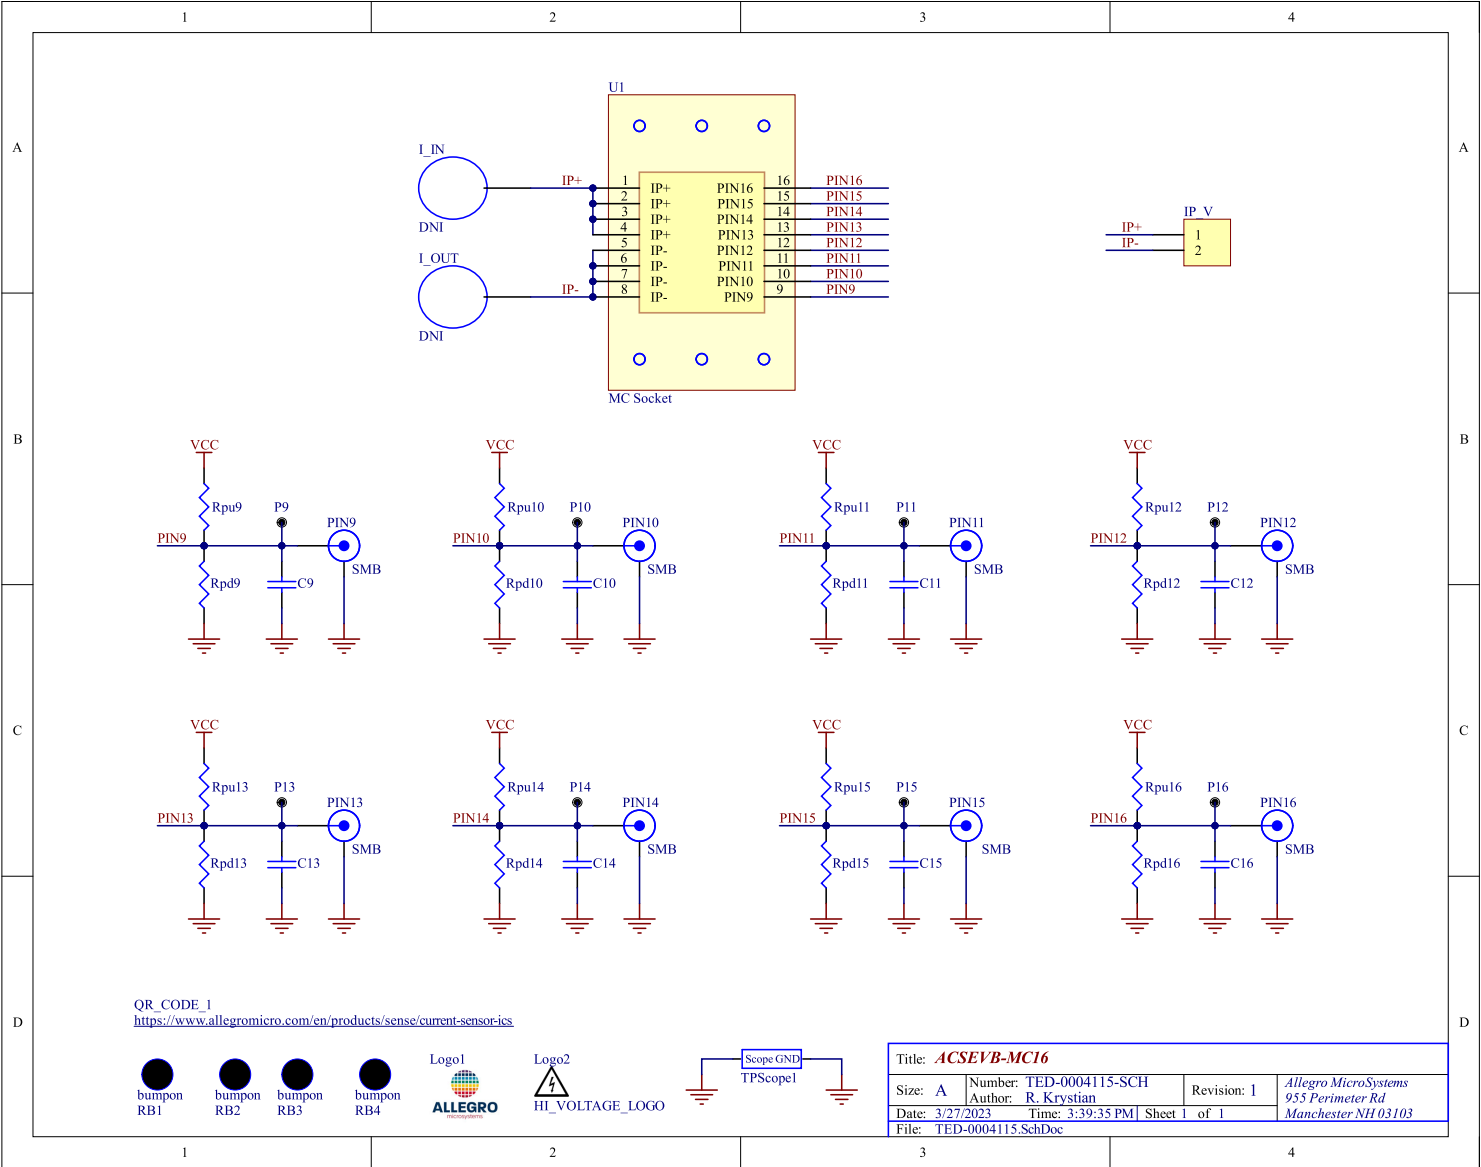

SCHEMATIC

Figure 7: MC Generic Evaluation Board Schematic

LAYOUT

The MC current sensor evaluation board has the option for a 2-pin 100 mil header connector, which allows the integrated current loop resistance to be measured directly from the evaluation board. The voltage drop sensing is routed in the first internal layer (as to not reduce isolation spec of the package). As a consequence, the voltage drop will include the parasitic resistance of the vias between the top layer and the first interior layer.

SUPPORTING CIRCUITRY

Components listed are based on the typical application circuit given in the respective device datasheet. In the event of a conflict between this document and the main datasheet, the datasheet takes precedence.

Table 1: Evaluation Board Circuitry

ACS37002 ASSEMBLY VARIANT (MC)

Pin	Terminal	Components
1, 2, 3, 4	IP+	Terminals for current being sensed; fused internally
5, 6, 7, 8	IP-	
9	OCF	Overcurrent fault, open-drain, requires pull-up resistor
10	VCC	Device power supply terminal, connected to supply voltage
11	VREF	Zero current voltage reference
12	VOUT	Analog output representing the current flowing through IP, optional load capacitance or load resistance
13	VOC	Overcurrent fault operation point input, connected to resistor divider or external power source
14	GAIN_SEL_1	Gain selection bit 1, connected to high or GND
15	GND	Device ground terminal, connected to GND
16	GAIN_SEL_0	Gain selection bit 0, connected to high or GND

ACS37003 ASSEMBLY VARIANT (MC)

Pin	Terminal	Components
1, 2, 3, 4	IP+	Terminals for current being sensed; fused internally
5, 6, 7, 8	IP-	
9, 10, 14, 15	OCF	Overcurrent fault, open-drain, requires pull-up resistor
11	VREF	Overcurrent fault operation point input, connected to resistor divider or external power source
12	VOUT	Analog output representing the current flowing through IP, optional load capacitance or load resistance
13	VREF	Zero current voltage reference
16	GND	Device ground terminal, connected to GND

ACS724/25 ASSEMBLY VARIANT (MC)

Pin	Terminal	Components
1, 2, 3, 4	IP+	Terminals for current being sensed; fused internally
5, 6, 7, 8	IP-	
9, 11, 14, 16	NC	No internal connection; recommended to be left unconnected in order to maintain high creepage
10	VCC	Device power supply terminal, connected to supply voltage
12	VOUT	Analog output representing the current flowing through IP, optional load capacitance or load resistance
13	FILTER	Terminal for external capacitor that sets bandwidth
15	GND	Device ground terminal, connected to GND
